

NATIONAL MOTH RECORDING SCHEME

Micromoth Verification Guidelines

VC55: Leicestershire & Rutland

April 2018

Introduction to the National Guidelines

The national 'Verification Guidelines' were devised and compiled to help recorders and County Recorders decide which micro-moths need careful consideration before records should be submitted to the National Moth Recording Scheme. In some cases the Regional, or even the National panels, that have been put in place to support the County Recorders may need referring to.

There will be plenty of the larger micro-moths, such as *Pleuroptya ruralis* (Mother of Pearl), *Anania hortulata* (Small Magpie), *Hypsopygia costalis* (Gold Triangle) and *Pterophorus pentadactyla* (White Plume Moth), where the moths can be easily identified and where no similar looking species occur. Typically, these records will be accepted as submitted and only those which occur outside their usual flight period, habitat or geographical range are likely to be questioned. However, it will help if these checks are made to rule out any potential misidentifications before submitting the record. This sort of information is readily available in books and on-line facilities. Once experience has been gained with the different families there will be many species that can be accepted without further evidence being required. If a recorder has had the species checked before it is unlikely that subsequent records of the same species will need querying again (unless dissection is required or, perhaps, the species is very scarce).

The criteria contained within the guidelines aim to provide a framework for the verification of micro-moths for the National Moth Recording Scheme. These criteria cover the adult moths and also species more regularly recorded as leaf-mines or as larval cases (N.B. this document only covers the criteria for adult moths). The criteria are applicable at the UK level, but can be adapted locally.

VC55 Guidelines

All data collected by the Leicestershire and Rutland Moth Group is forwarded to both County and National Recording Schemes. It is essential that the records are a reliable source of information, and this is especially important where the information may be utilised in support of any conservation initiatives. For this reason, species have been assigned a category to give guidance as to the evidence required for any record of that species to be fully acceptable. These are broadly in line with National guidelines, however they may be more stringent considering current local status (e.g. where a generally common species has not been recorded from VC55).

Records are collated by the County Recorder, and if necessary are assessed by a panel that includes some of the most experienced and well-regarded lepidopterists within the County. Where appropriate the panel will consult with outside expertise for comments and assistance.

The term 'distinctive' infers that the species can usually be identified by external features/markings alone. However, the specific identification of poorly marked or worn specimens should be considered with care and may require higher verification.

If retaining a specimen to obtain a subsequent identification, ensure that all supporting detail is retained with the specimen (recorder, date, site, trapping/collecting method).

Records should be submitted with full supporting detail: dates for light trapping/nocturnal records should refer to the evening that the trapping/collecting method was started; records for species encountered during daylight should be annotated as such; site details should ideally include six-figure grid references; the trapping/collection method should be given, and where appropriate detail of supporting evidence should be noted (eg 'specimen retained', 'specimen provided', 'gen det by', 'verified by', 'photographed').

If you are unsure as to what evidence is required or how much detail is required, remember that more is far preferable to not enough!

Adult Micromoth Recording Categories - VC55

Category 1:

Distinctive species that are unlikely to be confused with others, and are generally common in VC55.

Records will usually be accepted without supporting evidence. This category generally applies to species that will quickly become familiar to those gaining experience in micromoths.

Category 2:

Species that can be confused with others, or which may be uncommon/scarse in VC55.

Good quality photographs or a specimen may be required, or seek verification from an experienced recorder. If previously submitted records from the recorder or for the site have been accepted, then Category 1 criteria apply. In effect, records will be accepted from experienced micromoth recorders, without supporting evidence.

Category 3:

Rare or very scarce species in VC55 (including some adventive/immigrant species).

A clear set of photographs. showing all critical identification features is required, and/or a voucher specimen may be necessary - check with the County Recorder before releasing the moth.

Category 4: (Dissection Required)

Species that cannot be reliably identified as adults by external characteristics alone.

Dissection is required to confirm records to full species. Where appropriate, a few species pairs can be recorded as 'aggregates' (e.g. *Acleris ferrugana/notana*) if not dissected.

Category 5: (Specimen Required)

Species where there are currently no previous, confirmed or post-VCH records. A voucher specimen is required.

Contact the County Recorder before releasing the moth or after the moth has been set and identified. In some exceptional circumstances, a clear set of photographs showing all critical identification features may be sufficient to support a record of this species.

Notes on Detailed Listings

ABH	Agassiz, Beavan & Heckford checklist number (new)
B&F	Bradley & Fletcher checklist number (old)
Species	Micromoth species – N.B. This version only contains details of species already recorded from VC55; for other species (all of which will be Category 5), details can be found in the electronic version.
Vernacular	Includes only the widely accepted vernacular names. Whilst other micromoths may have been given a vernacular name, such names are not commonly known/used by experienced micromoth recorders and should therefore be avoided for record submission purposes
VC55 Listed	Y = Yes, the species has been recorded from VC55 (provisionally in some instances)
First VC55 Record	Provisional as historical records are still being researched. 1907 probably means it was listed in the Victoria County History of Leicestershire (VCH).
Last VC55 Record	Only applies to records up to the end of 2016, apart from VC55 firsts in 2017
Records in VC55 Database	Number of records up to the end of 2016, apart from VC55 firsts in 2017
Specimens in VC55 Collection	Number of specimens in the VC55 reference collection (held by Leicestershire Museums Service). In some instances, data from specimens may not yet have been incorporated into the records database.
VC55 Verification Grade	As detailed above
National Guide Comment	Comments included in the national guidelines
